## Odd Palindrome

We say that a string is odd if and only if all palindromic substrings of the string have odd length.
Given a string $s$, determine if it is odd or not.
A substring of a string $s$ is a nonempty sequence of consecutive characters from $s$. A palindromic substring is a substring that reads the same forwards and backwards.

## Input

The input consists of a single line containing the string $s(1 \leq|s| \leq 100)$.
It is guaranteed that $s$ consists of lowercase ASCII letters ('a'-‘z') only.

## Output

If $s$ is odd, then print "Odd." on a single line (without quotation marks). Otherwise, print "Or not." on a single line (without quotation marks).

## Sample Input and Output

| amanaplanacanalpanama | Odd. |
| :--- | :--- |
| madamimadam | Odd. |

| annamyfriend | Or not. |
| :--- | :--- |

| nopalindromes | Odd. |
| :--- | :--- |
