Problem G - Limit 3 seconds
Security Badge

You are in charge of the security for a large building, with $n$ rooms and $m$ doors between the rooms. The rooms and doors are conveniently numbered from 1 to $n$, and from 1 to $m$, respectively.

Door $i$ opens from room $a_{i}$ to room $b_{i}$, but not the other way around. Additionally, each door has a security code that can be represented as a range of numbers $\left[c_{i}, d_{i}\right]$.

There are $k$ employees working in the building, each carrying a security badge with a unique, integer-valued badge ID between 1 and $k$. An employee is cleared to go through door $i$ only when the badge ID $x$ satisfies $c_{i} \leq x \leq d_{i}$.

Your boss wants a quick check of the security of the building. Given $s$ and $t$, how many employees can go from room $s$ to room $t$ ?

## Input

The first line of input contains three space-separated integers $n$, $m$, and $k$ ( $2 \leq n \leq 1,000 ; 1 \leq m \leq$ 5,$000 ; 1 \leq k \leq 10^{9}$ ).

The second line of input contains two space-separated integers $s$ and $t(1 \leq s, t \leq n ; s \neq t)$.
Each of the next $m$ lines contains four space-separated integers $a_{i}, b_{i}, c_{i}$, and $d_{i}\left(1 \leq a_{i}, b_{i} \leq n\right.$; $1 \leq c_{i} \leq d_{i} \leq k ; a_{i} \neq b_{i}$ ), describing door $i$.

For any given pair of rooms $a, b$ there will be at most one door from $a$ to $b$ (but there may be both a door from $a$ to $b$ and a door from $b$ to $a$ ).

## Output

Print, on a single line, the number of employees who can reach room $t$ starting from room $s$.

## Sample Input and Output

$\left.\begin{array}{|lll|l|}\hline 4 & 5 & 10 & 5 \\ 3 & 2 & & \\ 1 & 2 & 4 & 7 \\ 3 & 1 & 1 & 6 \\ 3 & 4 & 7 & 10 \\ 2 & 4 & 3 & 5 \\ 4 & 2 & 8 & 9\end{array}\right]$
